

Iodine

This Food Fact Sheet will tell you more about iodine, its food sources and how much you need.

What is iodine?

Iodine is a mineral that is important for health. It is needed to make hormones in the thyroid. These hormones are needed for many body processes including growth, regulating metabolism and for the development of a baby's brain during pregnancy and early life.

Do we get enough iodine in the UK?

For many years iodine intake in the UK was thought to be more than adequate but recent research has shown mild iodine deficiency in schoolgirls and pregnant women. There is now concern that many adult women may not be getting enough iodine, particularly in pregnancy.

How much iodine do I need?

Life stage	Iodine required per day (mcg)*
Adults	150
Pregnant women	250
Breastfeeding women	250

*World Health Organisation requirements

What happens if I do not have enough iodine?

A low intake of iodine over a long period of time may cause your thyroid to work harder to keep the right amount of thyroid hormones in your blood. This can mean that your thyroid increases in size in order to trap iodine; this swelling - or 'goitre' - may be visible in your neck. However, visible goitre due to low iodine intake is rare in the UK. It is more likely that having too little iodine in your diet will lead to low levels of thyroid hormones. If you have a deficiency of iodine when you are pregnant, your baby's brain may not develop as well as it could and this could affect your child's ability to learn

in later years; for instance, your child could have a lower IQ or poorer reading ability.

Before and during pregnancy and breastfeeding

As iodine is required from the early stages of pregnancy, you should make sure you have been having enough iodine in your diet for several months before you get pregnant. This is because you can build up good stores of iodine in your thyroid before you become pregnant which helps it to function well during pregnancy. Therefore, if you are of childbearing age, and especially if you are planning a pregnancy, you should ensure that you meet the adult requirement for iodine.

During pregnancy, the amount of iodine you need increases. This is because you have to make sufficient thyroid hormones to transfer to your baby to help its brain develop correctly. You also supply all the iodine that the baby needs. Iodine deficiency in pregnancy may have serious consequences for your child so it is very important that you meet the higher iodine requirement if you are pregnant. Breastfeeding mums still need a higher amount of iodine, so their breast milk has enough iodine for their baby. This is because the brain is still developing at that early stage.

Where is iodine found in the diet?

Iodine is found in a range of foods, the richest sources being fish and dairy products. Seaweed is a concentrated source of iodine, but it can provide excessive amounts (particularly so in the case of brown seaweed such as kelp) and therefore eating seaweed more than once a week is not recommended, especially during pregnancy.

Milk and dairy products are the main sources of iodine for most people. Research has shown that

organic milk has a 40% lower iodine content than conventional milk.

In many countries, iodine is added to table salt to give “iodised salt”. Iodised salt is not widely available in the UK but can be found in some branches of several supermarket chains. As government recommendations are to reduce salt intake for health reasons, you should not rely on iodised table salt as a means of increasing your iodine intake.

The actual amount of iodine in food varies according to the iodine content of the soil, farming practice, fish species and season. This makes it difficult to estimate iodine per portion. The figures in the table are therefore for guidance only. Remember to follow Government advice on foods to avoid during pregnancy.

Food	Portion	Average iodine/portion (mcg) (actual iodine content will vary)
Cow's milk	200ml	50-80**
Organic cow's milk	200ml	30-65**
Yoghurt	150g	50-100**
Eggs	1 egg (50g)	20
Cheese	40g	15
White fish	100g	115
Oily fish	100g	50
Shellfish	100g	90
Meat	100g	10
Poultry	100g	10
Nuts	25g	5
Bread	1 slice (36g)	5
Fruit and veg	1 portion (80g)	3

**Depending on the season, higher value in winter

Can I have too much iodine?

Yes - excessive iodine intake can cause thyroid problems and should be avoided. As a guide, adult intakes should not exceed 600 mcg/day.

Who is at risk of iodine deficiency?

Anyone who avoids fish and/or dairy products (e.g.

due to allergy or intolerance) could be at risk of iodine deficiency. Soya milk is often not fortified with iodine (check the label) and therefore will not replace the iodine in cow's milk. Vegetarians and particularly vegans are at risk of iodine deficiency as they do not eat rich iodine sources (fish and/or dairy products).

What about an iodine supplement?

Most adults following a healthy, balanced diet that contains milk, dairy products and fish, should be able to meet their iodine requirements. A supplement containing iodine can help meet your iodine needs if you do not consume sufficient iodine-rich foods. If you have thyroid disease, are taking other medication, or have experienced iodine deficiency over many years, you should speak to your GP before taking additional iodine. Iodine in supplements should be in the form of 'potassium iodide' and should not exceed the daily adult requirement of 150 mcg. Do not use seaweed or kelp supplements as an iodine source; this is because the amount of iodine in such supplements can vary considerably from the value claimed on the label and can provide excessive quantities of iodine.

It can be difficult to meet the higher recommendations for iodine during pregnancy and breastfeeding through diet alone, especially if you do not eat rich sources of iodine. Many, but not all, multivitamin and mineral pregnancy supplements contain iodine, so you need to check the label. The supplement should provide 140 or 150 mcg, so the remainder of the requirement for pregnancy can be met by your diet. If you consume high quantities of iodine-rich foods during pregnancy, you may not need an iodine supplement; talk to your doctor if you are uncertain.

Summary

Iodine is important for the production of thyroid hormones. It is dangerous to have too little or too much iodine. Good dietary sources include fish, shellfish and dairy products. During pregnancy, iodine is essential for the correct development of the baby's brain.
